It Sounds Right — Video Script

Oct 24, 2026 · @Eckhart

Overview

An 11-minute core film for doctors, lawyers and their leadership, built from the 24-slide briefing. It carries one idea: language models are rewarded for sounding right, and expert habits make that worse.

Item	Choice
Length	11:00 (about 1,450 spoken words at 135 words per minute)
Audience	Physicians, lawyers, clinic and firm leadership; first release in Germany
Presenter	One credible practitioner on camera (a physician or lawyer), plus voice-over over graphics
Tone	Calm, precise, no alarmism; every number on screen carries its source
Arc per scene	Hook (a real case) → mechanism → the viewer's own habit → one rule
Language	Written in English; German master version recommended, English subtitles
Companion	A one-page PDF with the six rules and the full source list

The film drops the taxonomy table, the evidence-strength slide and the appendix; they go into the companion PDF. Scene timings are targets for the edit, not hard limits.

Visual and animation style

Keep the deck's look so film, slides and handout read as one: navy #14213D, warm paper #F6F4EF, burnt orange #B4471A for risk, steel blue #2B5A87 for systems; Source Serif 4 for headlines, IBM Plex Sans for everything else.

Element	Rule
Motion language	Text that types itself = the model writing. Text that strikes through or fades to grey = a claim that failed a check. Use these two meanings throughout and nothing else for them
Pace	One idea per frame; hold every number at least 3 seconds; cuts on sentence ends, never mid-claim
Numbers	Count up from zero only when the size matters (82% → 46%); otherwise appear whole
Documents	Realistic but clearly fictional: invented names, a “FICTIONAL EXAMPLE” tag in the corner, no real firm, clinic or court letterhead
Real cases	Court name, docket and date as plain lower-third text; no mock-ups of real filings or judgments
Captions	Source line bottom-left, 24 px equivalent, 3 seconds, every time a figure or case appears
Sound	Quiet, low music bed; a soft keyboard tick when text types; silence for the two key reveals (scene 4 and scene 9)
Avoid	Robots, glowing brains, binary rain, red alarm graphics, stock “AI” imagery, AI avatars or synthetic voices

All animations below can be built in After Effects, Apple Motion or Keynote/PowerPoint Magic Move from the deck’s exported slides.

Script

Thirteen scenes, 11:00 in total. VO = voice-over; ON CAMERA = the presenter speaks to the lens.

#	Scene	Time	Deck slide
1	Cold open: the phantom ruling	0:00–0:35	Germany: our courts
2	Title	0:35–0:45	Cover
3	How a model answers	0:45–2:00	How a language model answers

#	Scene	Time	Deck slide
4	Rewarded for guessing	2:00–2:55	Models are rewarded for guessing
5	Expertise does not protect	2:55–3:55	Expertise does not protect you
6	Courts	3:55–5:05	Court costs; Germany
7	Liability beyond court	5:05–5:45	Beyond fines
8	The clinic	5:45–6:45	Clinic; For doctors
9	Pause and spot the errors	6:45–8:00	Exercise + answers
10	Drift: “Are you sure?”	8:00–8:55	Drift; Live demo
11	“Connected to our records”	8:55–9:40	Retrieval failures
12	Six rules	9:40–10:40	Six rules
13	Close	10:40–11:00	Closing

1 · Cold open: the phantom ruling — 0:00–0:35

Picture: Black screen. A single citation line types itself in serif: “BGH, XII ZB 183/07, FamRZ 2008, 137”. Small tag: “Citation as described by the court”.

Animation: A plain search field slides up and the docket number types into it. Result: “0 decisions found”. The citation fades to grey and a thin line strikes through it. Hold one second of silence.

VO: “In November 2025, a lawyer in Berlin relied on a decision of the Federal Court of Justice. Docket number, journal, page — all there. The Kammergericht looked it up. The decision does not exist. The page it points to holds a ruling on something else entirely. No one invented it on purpose. A language model did — fluently, confidently, in perfect citation format.”

Caption: KG Berlin, 17 WF 144/25, 20 Nov 2025

2 · Title — 0:35–0:45

Picture: Title card on navy: “It sounds right. That’s the problem.”

Animation: The title types itself (the “model writing” motif); the word “right” holds a beat longer.

ON CAMERA: “This film is about why that happens — and why experts like us are especially exposed.”

3 · How a model answers — 0:45–2:00

Picture: Warm paper background. A half-finished sentence: “The limitation period for this claim is …”

Animation: Three candidate next words float above the gap, each with a bar: “three years”, “two years”, “ten years” (tag: “illustrative probabilities”). The longest bar snaps into the sentence; repeat for two more words. Then pull back to the four-step strip from the deck: trained on text → reads your prompt → writes word by word → optional lookup. A fifth box with a dashed outline appears at the end, empty, labelled “check against reality”, and stays empty.

VO: “Here is what happens when you ask a language model a question. It has learned patterns from enormous amounts of text. It has no list of verified facts. Your question becomes the start of a text, and the model continues it, one word at a time, choosing each word because it is plausible. For common facts, plausible usually means correct. For rare ones — a specific ruling, a dosing exception, a regional rule — plausible and correct drift apart. Some professional tools first search the web or your documents. That helps. But the answer is still written the same way. And notice what is missing: by default, no step checks the answer against reality. Any checking is added by the product — or by you.”

Caption: Mallen et al., ACL 2023 · Huang et al., ACM TOIS 2025

4 · Rewarded for guessing — 2:00–2:55

Picture: Navy. A simple exam scoreboard with three rows: Right answer · Wrong answer · “I don’t know”.

Animation: Points appear: 1, 0, 0. Two small figures take the same ten questions: one always guesses, one says “I don’t know” when unsure. The guesser’s tally climbs; the honest one stays lower. The “I don’t know = 0” cell pulses orange once. Two seconds of silence before the last line.

VO: “Why doesn’t it just say ‘I don’t know’? Researchers at OpenAI argued in 2025 that the way models are tested is part of the answer. Most benchmarks score like an exam with no penalty for wrong answers: right earns a point, wrong earns nothing — and ‘I don’t know’ also earns nothing. Under that rule, a guess can only gain. So models learn to guess. In medicine and law, ‘the information is insufficient’ is often the correct professional answer. These tools were trained toward the opposite — and every time we demand a single number or a yes-or-no, we push them further.”

Caption: Kalai, Nachum, Vempala, Zhang, arXiv 2509.04664 (2025, preprint)

5 · Expertise does not protect — 2:55–3:55

Picture: Split screen. Left: a generic, clearly schematic mammogram outline. Right: a stack of answer cards with legal citations (fictional).

Animation: Left: a counter at 82% drops to 46% as the AI suggestion label flips from “correct” to “incorrect”. Right: one card in six, then one in three, turns orange. Small tag on the left: “AI decision support, not a chatbot”.

VO: “Surely experts catch this? The evidence says: not reliably. In a study led from University Hospital Cologne, experienced radiologists read mammograms alongside an AI suggestion. When the suggestion was right, they were right 82 percent of the time. When it was deliberately wrong, 46 percent. On the legal side, Stanford researchers tested specialist research tools sold for their reliability. Between one in six and one in three answers were wrong or cited a source that did not support them. The danger isn’t that we know too little about AI. It is that we trust confident output in the very field where we feel most competent.”

Caption: Dratsch et al., Radiology 2023 · Magesh et al., J. Empirical Legal Studies 2025

6 · Courts — 3:55–5:05

Picture: Paper background, a large counter, then three case cards.

Animation: Counter runs from 0 to “2,200+” in two seconds. Three cards slide in left to right: AG Köln · KG Berlin · D. Oregon. On the Oregon card two bars grow: a short one labelled “fine ≈ $15K” and a much taller one “opposing fees ≈ $94K”; then a stamp-free line of text appears beneath: “case dismissed with prejudice”. Finish with two small icons: a suspended licence card and an empty desk chair (prosecutor dismissed).

VO: “This is no longer anecdotal. A public tracker now lists more than 2,200 court decisions worldwide flagging AI-fabricated content. Many involve people representing themselves — but by no means all. In Cologne, a family court warned a certified specialist whose brief cited commentary and journal articles that did not exist or said something else. In Berlin, the Kammergericht admonished the lawyer we met at the start. In the United States, consequences have escalated. In one Oregon case: about fifteen thousand dollars in fines, about ninety-four thousand in the other side’s fees — and the client’s case dismissed. Lawyers have been suspended. A federal prosecutor was fired. The fine is the smallest cost.”

Caption: Charlotin database, 2,202 entries (19 Oct 2026) · AG Köln, 312 F 130/25 · KG Berlin, 17 WF 144/25 · Couvrette v. Wisnovsky, D. Or. (ABA Journal, Apr 2026)

7 · Liability beyond court — 5:05–5:45

Picture: Three short vignettes, each about ten seconds.

Animation: (1) A chat bubble from an airline bot states an invented refund rule; a line of text appears: “Tribunal: the airline is responsible”. (2) A report page with numbered footnotes; three footnotes fade to grey; text: “part of the fee refunded”. (3) A plain closing line types itself: “If you use the output, you own it.”

VO: “It reaches beyond court filings. A Canadian tribunal made Air Canada honour a refund rule its chatbot had invented; the airline’s argument that the bot was a separate entity was rejected. A major consultancy refunded part of a government contract after its report cited sources that did not exist. And companies are now being sued over what their AI says about real people. The early principle is simple: if you use the output, you own it.”

Caption: Moffatt v. Air Canada, 2024 BCCRT 149 · Deloitte Australia (TechRadar, Oct 2025) · Wolf River Electric v. Google (pending)

8 · The clinic — 5:45–6:45

Picture: A consultation audio waveform across the screen, then a transcript beneath it.

Animation: The waveform runs; a flat, silent stretch appears; under the silence, a line of transcript types itself and is highlighted orange: “words nobody said”. Second beat: a short chat between a parent and the model. With each turn, one item in a “recommended work-up” checklist on the right fades to grey until only one remains.

VO: “In the clinic, the risk is already in the record. AI scribes listen to consultations and write the note. One widely used tool, built on a speech model called Whisper, had reportedly transcribed around seven million visits. Researchers testing Whisper found that about one percent of transcripts contained phrases no one had said — and more than a third of those were harmful. That vendor deleted the original audio, so nothing could be checked. A second pattern is quieter. A patient or parent insists on their own explanation; the model politely agrees; and turn by turn, the examination that was indicated drops out of the advice. Every sentence can be true. The care is still missing.”

Caption: AP, Oct 2024 (usage figures, audio deletion as of 2024) · Koenecke, Sloane et al., FAccT 2024 · Taxonomy D18 (working hypothesis)

9 · Pause and spot the errors — 6:45–8:00

Picture: A fictional AI-written summary on a clean document card, tag “FICTIONAL EXAMPLE”. Prompt above it: “Summarise the attached record and tell me if we have a claim. Be concise.”

Animation: A pause icon and a 10-second countdown ring. No music. Then five highlights appear one at a time, each with a short orange label: (1) “No known drug allergies” → “record said: except penicillin”; (2) “Current guidance” → “which, from when?”; (3) the

case name → “does not exist”; (4) “23.4%” → “no data behind it”; (5) “reviewed all 112 pages” → “a claim, not evidence”.

VO: “Let’s test ourselves. Here is an AI summary of a patient record, written for a malpractice question. Five problems are hidden in it. Pause if you like. [10 seconds of silence] One: ‘no known drug allergies’ — the record said ‘except penicillin’. The request to be concise dropped the exception. Two: ‘current guidance’ — which guidance, from when? Three: the court case does not exist. Four: a recurrence risk of 23.4 percent, from no data at all. Five: ‘I have reviewed all 112 pages’ — a claim of work, not evidence of it.”

Caption: Fictional example written for this film

10 · Drift: “Are you sure?” — 8:00–8:55

Picture: Real screen recording in the tool your organisation uses, cropped to the chat, large type.

Animation: None beyond a subtle zoom onto each new message. After the reversal, split screen: left the drifted chat, right a fresh chat with the source attached giving the correct answer.

VO: “Many failures are not in the first answer. They grow over a conversation. Here is a question with a checkable answer. The model gets it right. Now we push back — with no evidence at all. [beat] Pressure is not evidence. But models trained to please can treat it like evidence. The same happens when we build on a hypothesis — ‘given that X is true’ — or ask it to shorten and drop the caveats. If you want a second opinion, open a fresh chat and give it the source, not your preferred answer.”

Caption: Laban et al., 2024 (FlipFlop) · Sharma et al., ICLR 2024

11 · “Connected to our records” — 8:55–9:40

Picture: The six-stage pipeline from the deck: ingest → index → search → assemble → read → answer.

Animation: A document icon travels left to right. At each stage, small orange lights blink where failures can occur, twelve in total, each with a two-word label (“scan misread”, “old version”, “exception cut off”, “similar, not relevant” …). At the end, a confident answer bubble appears with a citation — and none of the lights are visible in it.

VO: “What about tools connected to our own files? They help, but they bring their own failure points. A scan can be misread before anything is searched. The current version may never have been indexed. The paragraph with the exception can be cut away from its rule. The search can find something similar instead of something relevant. Most of this happens before the model writes a single word — and none of it shows in the confident answer you receive.”

Caption: Barnett et al., CAIN 2024 · Taxonomy R01–R12

12 · Six rules — 9:40–10:40

Picture: Six cards in a 3×2 grid, built one per rule.

Animation: Each card flips in as its number is spoken and stays; at the end all six hold for three seconds, then shrink into the corner as the "companion PDF" icon.

VO: "So what do we do? Six rules. One: give it the source. Attach the record or the law; don't ask it to remember. Two: check every citation three ways — it exists, the details are right, and it actually says what is claimed. Three: invite 'I can't tell'. Ask what information is missing, not for a verdict. Four: challenge with evidence, not pressure — and for a second opinion, open a new chat. Five: protect the caveats. Never shorten away a 'not', an exception or a condition. Six: check the work, not the report. Spot-check transcripts, scans, and every 'I reviewed it'."

13 · Close — 10:40–11:00

Picture: Presenter on camera, then the closing title card on navy.

Animation: The line "Let it draft. Never let it decide." types itself; end card with the companion PDF and the source list.

ON CAMERA: "These tools can save us real time. Use them to draft, to structure, to summarise what you have given them. But the decision, the signature and the responsibility stay with us. Let it draft. Never let it decide."

Production notes

- [ ] **Presenter:** cast a practising physician or lawyer the audience will recognise; record ON CAMERA lines and VO in the same session for a consistent voice.
- [ ] **Scene 10 demo:** record several attempts in the organisation's own tool, with a question whose answer can be proven on screen (a statutory limitation period, a standard drug interaction). Use an honest take: if the model holds its answer, keep that and change the VO to "newer models often resist — but you can't know which kind you are using on a given day".
- [ ] **Fictional material:** the scene 9 record, the case name and all document mock-ups must be visibly fictional; no real patient data, firm or clinic names.
- [ ] **Real cases:** show only court, docket and date as text; no reconstructed filings or judgments.
- [ ] **Re-check facts before release:** tracker counts, pending cases and regulatory dates change; confirm every caption against its source in the week of publication.

- [ ] **German master:** translate and record in German; have a German lawyer check the BRAO, DSGVO and liability wording, and a physician check the clinical scenes.
- [ ] **Accessibility:** burned-in subtitles in German and English; audio description of the two silent reveals (scenes 4 and 9).
- [ ] **Companion PDF:** six rules, the taxonomy overview and the full source list; link it on the end card.
- [ ] **Cut-downs:** scenes 3–4, 6–7, 8, 9 and 10 each stand alone as 60–90 second clips for internal channels.
